IS YOUR SUNSCREEN A KILLER?

After you get into the ocean, your sunscreen melts off your body and sits on the sea surface. This oily film doesn't allow sunlight to reach the coral and slowly starves it

To save yourself and the ocean, choose a mineral based

MINERAL VS CHEMICAL SUNSCREEN–

Mineral: Reflects UV rays, starts working immediately, doesn't absorb into skin so it's safe for humans and for the ocean

Chemical: Scatters UV rays throughout the body instead of reflecting them, takes ~20min to be effective, absorbed into skin, pollutes and kills ocean life including coral reefs
